ABSTRACT

LIQUID CRYSTAL ALIGNMENT

5   A liquid crystal device has a surface alignment
     structure comprising a random or pseudorandom two
     dimensional array of alignment features (10) which are
     shaped and/or orientated to produce a desired
     alignment. Depending on the geometry and spacing of
10   the features (10), the liquid crystal may be induced to
     adopt a planar, tilted, or homeotropic alignment.
